# COMP 540 HW 01

Lyu Pan (lp28), Yuhui Tong (yt30) January 18, 2018

# 0. Background Refresher

# 0.0 Samplers

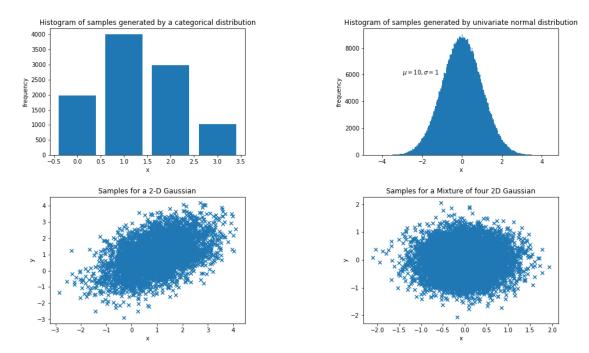

Figure 1: Visualization of four distributions

Figure 1 visualize four distributions. Specifically, for a mixture distribution of four 2D Gaussians, the probability that a sample from this distribution lies within the unit circle centered at (0.1, 0.2) is p = 0.83736.

# 0.1 Prove two independent Poisson random variables are also Poisson variable.

Proof:

Given two independent random variables  $X_1 \sim P(\lambda_1)$  and  $X \sim P(\lambda_2)$ . i.e.,

$$P(X_1 = m) = e^{-\lambda_1} \frac{\lambda_1^m}{m!}, \ m = 1, 2, \dots$$
 (1)

and

$$P(X_2 = n) = e^{-\lambda_2} \frac{\lambda_2^n}{n!}, \quad n = 0, 1, 2, \dots$$
 (2)

Denote sum of them are

$$X = X_1 + X_2 \tag{3}$$

then the probability distribution of X is:

$$P(X = k) = \sum_{m+n=k} P(X_1 = m, X_2 = n)$$

$$X_{1,X_2 indep.R.V.} = \sum_{m+n=k} P(X_1 = m)P(X_2 = n)$$

$$= \sum_{m+n=k} e^{-\lambda_1} \frac{\lambda_1^m}{m!} e^{-\lambda_2} \frac{\lambda_2^n}{n!}$$

$$= \frac{1}{k!} e^{-(\lambda_1 + \lambda_2)} \sum_{m+n=k} \frac{k!}{m!n!} \lambda_1^m \lambda_2^n$$

$$= \frac{1}{k!} e^{-(\lambda_1 + \lambda_2)} (\lambda_1 + \lambda_2)^k$$
(4)

that is,  $X = X_1 + X_2 \sim P(\lambda_1 + \lambda_2)$ . Q.E.D.

# 0.2 Proof question 2

$$p(x_{1},x_{0}) = p(x_{1}|x_{0})p(x_{0})$$

$$= \alpha e^{-\frac{(x_{1}-x_{0})^{2}}{2\sigma^{2}}}\alpha_{0}e^{-\frac{(x_{0}-\mu_{0})^{2}}{2\sigma^{2}}}$$
(5)

The probability distribution of  $X_1$  is,

$$p(x_1) = \int_{-\infty}^{\infty} p(x_1, x_0) dx_0$$

$$= \int_{-\infty}^{\infty} \alpha e^{-\frac{(x_1 - x_0)^2}{2\sigma^2}} \alpha_0 e^{-\frac{(x_0 - \mu_0)^2}{2\sigma_0^2}} dx_0$$

$$= D \int_{-\infty}^{\infty} e^{-A[x_0 - B]^2 + C} dx_0$$
(6)

where A, B, C, D

$$D = \alpha \alpha_0 e^{-\frac{\mu_0^2}{2\sigma_0^2}} e^{-\frac{x_1^2}{2\sigma^2}} \tag{7}$$

$$A = \frac{\sigma_0^2 + \sigma^2}{2\sigma_0^2 \sigma^2},\tag{8}$$

$$B = \frac{x_1 \sigma_0^2 + \mu_0 \sigma^2}{\sigma_0^2 + \sigma^2},\tag{9}$$

$$C = \frac{(x_1 \sigma_0^2 + \mu_0 \sigma^2)^2}{2\sigma_0^2 \sigma^2 (\sigma_0^2 + \sigma^2)}.$$
 (10)

Making the substitution  $t = \sqrt{2A}(x_0 - B)$  gives

$$\int_{-\infty}^{\infty} e^{-A[x_0 - B]^2 + C} dx_0 = \int_{-\infty}^{\infty} e^{-\frac{t^2}{2} + C} d\frac{t}{\sqrt{2A}}$$

$$= \frac{1}{\sqrt{2A}} e^{-C} \int_{-\infty}^{\infty} e^{-\frac{t^2}{2}} dt$$

$$= \sqrt{\frac{\pi}{A}} e^{-C} \tag{11}$$

where in the second step we used  $\int_{-\infty}^{\infty} e^{-\frac{t^2}{2}} dt = \sqrt{2\pi}$ . Substituting the above equation to the Eq. (6) yields

$$p(x_1) = D\sqrt{\frac{\pi}{A}}e^{-C}$$

$$= \alpha\alpha_0 e^{-\frac{\mu_0^2}{2\sigma_0^2}}e^{-\frac{x_1^2}{2\sigma^2}}\sqrt{\frac{\pi}{A}}e^{-C}$$
(12)

# 0.3 question 4 eigenvalues

$$\boldsymbol{A} = \left[ \begin{array}{cc} 13 & 5 \\ 2 & 4 \end{array} \right]$$

$$\begin{array}{rcl}
\boldsymbol{AX} &=& \lambda \boldsymbol{X} \\
(\boldsymbol{A} - \lambda \boldsymbol{I}) \boldsymbol{X} &=& 0 \\
\begin{bmatrix}
13 - \lambda & 5 \\
2 & 4 - \lambda
\end{bmatrix} \boldsymbol{X} &=& 0
\end{array}$$

$$\lambda_1 = 3, \, \boldsymbol{X}_1 = \left( \begin{array}{c} -1/2 \\ 1 \end{array} \right)$$
 $\lambda_2 = 14, \, \boldsymbol{X}_2 = \left( \begin{array}{c} 5 \\ 1 \end{array} \right)$ 

# 0.4 question 5, matrix multiplication

$$A = \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}, B = \begin{bmatrix} 5 & 6 \\ 7 & 8 \end{bmatrix}, \text{ we have } (A+B)^2 \neq A^2 + 2AB + B^2$$
$$A = \begin{bmatrix} 0 & 1 \\ 0 & 1 \end{bmatrix}, B = \begin{bmatrix} 1 & 1 \\ 0 & 0 \end{bmatrix}, A, B \neq 0 \text{ and we have } AB = 0$$

## 0.5 question 6

$$A^{T}A = (I - 2uu^{T})^{T}(I - 2uu^{T})$$

$$= (I - 2uu^{T})(I - 2uu^{T})$$

$$= I - 2uu^{T} - 2uu^{T} + 4u(u^{T}u)u^{T}$$

$$= I$$
(13)

## 0.6 convex function

## 0.6.1

for  $x \ge 0$ 

$$f(x) = 3x^3 \tag{14}$$

$$f'(x) = 3x^2 \tag{15}$$

$$f''(x) = 6x \ge 0 \tag{16}$$

so,  $f(x) = x^3$  is convex.

#### 0.6.2

For any  $\lambda \in [0, 1]$ , we have  $\lambda \geq 0, 1 - \lambda \geq 0$ For any  $(x_1, y_1), (x_2, y_2) on \mathbb{R}^2$ 

$$f(\lambda(x_{1}, y_{1}) + (1 - \lambda)(x_{2}, y_{2})) = max(\lambda(x_{1}, y_{1}) + (1 - \lambda)(x_{2}, y_{2}))$$

$$\leq max(\lambda(x_{1}, y_{1})) + max((1 - \lambda)(x_{2}, y_{2}))$$

$$= \lambda max(x_{1}, y_{1}) + (1 - \lambda)max(x_{2}, y_{2})$$

$$= \lambda f(x_{1}, y_{1}) + (1 - \lambda)f(x_{2}, y_{2})$$
(17)

So, f(x) is convex.

## 0.6.3

Because f is convex on S, for  $\lambda \in [0,1]$  and all  $x_1, x_2 \in S$ , we have

$$f(\lambda x_1 + (1 - \lambda)x_2) \le \lambda f(x_1) + (1 - \lambda)f(x_2) \tag{18}$$

Also,

$$g(\lambda x_1 + (1 - \lambda)x_2) \le \lambda g(x_1) + (1 - \lambda)g(x_2) \tag{19}$$

Let h = f + g,

$$h(\lambda x_{1} + (1 - \lambda)x_{2}) = f(\lambda x_{1} + (1 - \lambda)x_{2}) + g(\lambda x_{1} + (1 - \lambda)x_{2})$$

$$\leq \lambda f(x_{1}) + (1 - \lambda)f(x_{2}) + \lambda g(x_{1}) + (1 - \lambda)g(x_{2})$$

$$= \lambda (f(x_{1}) + g(x_{1})) + (1 - \lambda)(f(x_{2}) + g(x_{2}))$$

$$= \lambda h(x_{1}) + (1 - \lambda)h(x_{2})$$
(20)

So, h is convex, i.e. f + g is convex.

## 0.6.4

# 0.7 entropy of categorical distribution

The entropy of a categorical distribution on K values is

$$H(p) = -\sum_{i=1}^{K} p_i \log(p_i),$$
 (21)

with constraint that

$$\sum_{i=1}^{K} p_i = 1. (22)$$

Using Lagrange Multiplier, one can combine the above two equations into:

$$L(p,\lambda) = -\sum_{i=1}^{K} p_i \log(p_i) + \lambda (\sum_{i=1}^{K} p_i - 1).$$
 (23)

Taking derivative of all unknown variables gives:

$$\frac{\partial L}{\partial p_i} = -(\log p_i + 1) + \lambda = 0, \ i = 1, 2, \dots$$
 (24)

Substituting  $p_i$  with  $\lambda$  yields

$$p_i = \frac{1}{K}, \ i = 1, 2, ..., K. \tag{25}$$

Q.E.D.

# 1. Locally weighted linear regression.

# 1.1 Expression of $J(\theta)$

Define  $\boldsymbol{X},\,\boldsymbol{W}$  in the following way:

$$\mathbf{X} = \begin{bmatrix} ---- (x^{(1)})^T - --- \\ ---- (x^{(2)})^T - --- \\ \vdots \\ ---- (x^{(m)})^T - --- \end{bmatrix} \iff \mathbf{X}_{i,j} = (x^{(i)})_j$$
 (26)

$$\mathbf{W} = \begin{bmatrix} w^{(1)} & & & \\ & w^{(2)} & & \\ & & \ddots & \\ & & & w^{(m)} \end{bmatrix} \iff \mathbf{W}_{i,j} = \delta_{i,j} w^{(i)}$$
 (27)

Substituting  $\boldsymbol{X},~\boldsymbol{W}$  into  $(\boldsymbol{X}\boldsymbol{\theta}-\boldsymbol{y})^T\boldsymbol{W}(\boldsymbol{X}\boldsymbol{\theta}-\boldsymbol{y})$  yields

$$\begin{aligned} (\boldsymbol{X}\boldsymbol{\theta} - \boldsymbol{y})^T \boldsymbol{W} (\boldsymbol{X}\boldsymbol{\theta} - \boldsymbol{y}) &= \sum_{i,j} \left[ (\boldsymbol{X}\boldsymbol{\theta} - \boldsymbol{y})^T \right]_{1,i} \boldsymbol{W}_{i,j} (\boldsymbol{X}\boldsymbol{\theta} - \boldsymbol{y})_{j,1} \\ &= \sum_{i,j} \delta_{i,j} w^{(i)} \left[ (\boldsymbol{X}\boldsymbol{\theta} - \boldsymbol{y})^T \right]_{1,i} (\boldsymbol{X}\boldsymbol{\theta} - \boldsymbol{y})_{j,1} \\ &= \sum_{i} w^{(i)} \left[ (\boldsymbol{X}\boldsymbol{\theta} - \boldsymbol{y})_{i,1} \right]^2 \\ &= \sum_{i} w^{(i)} \left[ \left( x^{(i)} \right)^T \boldsymbol{\theta} - y^{(i)} \right]^2 \\ &= \sum_{i} w^{(i)} \left[ \boldsymbol{\theta} x^{(i)} - y^{(i)} \right]^2 . \end{aligned}$$

So  $J(\theta) = \frac{1}{2} (\boldsymbol{X}\theta - \boldsymbol{y})^T \boldsymbol{W} (\boldsymbol{X}\theta - \boldsymbol{y})$ . Q.E.D.

## 1.2 Closed formed solution of $\theta$

$$\frac{\partial J(\theta)}{\partial \theta} = \frac{1}{2} \frac{\partial}{\partial \theta} \left[ (\mathbf{X}\theta - \mathbf{y})^T \mathbf{W} (\mathbf{X}\theta - \mathbf{y}) \right] 
= \frac{1}{2} \frac{\partial}{\partial \theta} tr \left[ \mathbf{y}^T \mathbf{W} \mathbf{X} \theta - \mathbf{y}^T \mathbf{W} \mathbf{y} - \theta^T \mathbf{X}^T \mathbf{W} \mathbf{X} \theta + \theta^T \mathbf{X}^T \mathbf{W} \mathbf{y} \right] 
= \mathbf{X}^T \mathbf{W} \mathbf{y} - \mathbf{X}^T \mathbf{W} \mathbf{X} \theta$$

where in the third line we used the following two equations<sup>1</sup>:

$$\frac{\partial tr(\mathbf{A}^T \mathbf{B})}{\partial \mathbf{A}} = \mathbf{B}^T \tag{28}$$

and

$$\frac{\partial tr(\mathbf{A}^T \mathbf{B} \mathbf{A})}{\partial \mathbf{A}} = \mathbf{B} \mathbf{A} + \mathbf{B}^T \mathbf{A}$$
 (29)

Therefore the closed form solution for  $\theta$  is

$$\theta = (\mathbf{X}^T \mathbf{W} \mathbf{X})^{-1} \mathbf{X}^T \mathbf{W} \mathbf{y}. \tag{30}$$

$$\begin{bmatrix}
\frac{\partial tr(\mathbf{A}^T \mathbf{B} \mathbf{A})}{\partial \mathbf{A}}
\end{bmatrix}_{i,j} = \frac{\partial A_{l,m}^T B_{m,n} A_{n,l}}{\partial A_{i,j}} = \frac{\partial A_{m,l} B_{m,n} A_{n,l}}{\partial A_{i,j}} \\
= \delta_{m,i} \delta_{l,j} B_{m,n} A_{n,l} + A_{m,l} B_{m,n} \delta_{n,i} \delta_{l,j} \\
= B_{i,n} A_{n,j} + A_{m,j} B_{m,i} \\
= (\mathbf{B} \mathbf{A})_{i,j} + (\mathbf{B}^T \mathbf{A})_{i,j},$$

hence leading to  $\frac{\partial tr(\boldsymbol{A}^T\boldsymbol{B}\boldsymbol{A})}{\partial \boldsymbol{A}} = \boldsymbol{B}\boldsymbol{A} + \boldsymbol{B}^T\boldsymbol{A}$ 

<sup>&</sup>lt;sup>1</sup>Take the second equation for example:

# 1.3 Batch gradient descent for locally weighted linear regression

The derivative of  $J_{\theta}$  is:

$$\frac{\partial}{\partial \theta} J(\theta) = \sum_{i=1}^{m} w^{(i)} (h_{\theta}(x^{(i)}) - y^{(i)}) x_j^{(i)}. \tag{31}$$

Therefore we have the following algorithm:

# Algorithm 1: Batch gradient descent algorithm for locally weighted linear regression

**Result:** The estimated parameters  $\theta$  for locally weighted linear regression

1 while  $\theta$  does not converge do

for every j do

5 end

# 2. Properties of linear regression estimator.

# **2.1 Prove** $E[\theta] = \theta^*$

Proof:

The following facts:

1. 
$$y^{(i)} = \theta^{*T} x^{(i)} + \epsilon^{(i)}$$
,

2. 
$$\epsilon^{(i)}, i = 1, 2, ..., m$$
 are *i.i.d.* of  $N(0, \sigma^2)$ ,

indicate that:

given fixed arbitrary  $x^{(i)}$  and fixed unknown parameter  $\theta^*$ ,  $y^{(i)}$ ,  $1 \le i \le m$  are i.i.d. of  $N(\theta^{*T}x^{(i)}, \sigma^2)$ 

$$p(y^{(i)}|x^{(i)}, \theta^*) = \frac{1}{\sqrt{2\pi}\sigma} e^{-\frac{(y^{(i)} - \theta^{*T}x^{(i)})^2}{2\sigma^2}}.$$
(32)

The least-square estimate of  $\theta^*$  is  $\theta$  given by

$$\theta = (X^T X)^{-1} X^T y$$

$$\stackrel{denote:(X^T X)^{-1} X^T \equiv A}{=} Ay$$
(33)

$$\stackrel{denote:(X^{T}X)^{-1}X^{T} \equiv A}{=} Ay \tag{34}$$

The expectation of  $\theta$  is

$$E[\theta] = E[\mathbf{A}\mathbf{y}] \tag{35}$$

$$= E \begin{bmatrix} \sum_{j} A_{1,j} y^{(j)} \\ \sum_{j} A_{2,j} y^{(j)} \\ \vdots \\ \sum_{j} A_{d+1,j} y^{(j)} \end{bmatrix}.$$
 (36)

Since expectations has the following property (regardless of the independence of  $Z_k$ ):

$$E[Z_1 + Z_2 + \dots + Z_l] = \sum_{k} Z_k, \tag{37}$$

we have

$$E[\theta] = E\begin{bmatrix} \sum_{j} A_{1,j} y^{(j)} \\ \sum_{j} A_{2,j} y^{(j)} \\ \vdots \\ \sum_{j} A_{d+1,j} y^{(j)} \end{bmatrix} = \begin{bmatrix} \sum_{j} A_{1,j} E[y^{(j)}] \\ \sum_{j} A_{2,j} E[y^{(j)}] \\ \vdots \\ \sum_{j} A_{d+1,j} E[y^{(j)}] \end{bmatrix}$$
(38)

$$= A \begin{bmatrix} E[y^{(1)}] \\ E[y^{(2)}] \\ \vdots \\ E[y^{(m)}] \end{bmatrix} = A \begin{bmatrix} \theta^{*T}x^{(1)} \\ \theta^{*T}x^{(2)} \\ \vdots \\ \theta^{*T}x^{(m)} \end{bmatrix}$$
(39)

$$= \mathbf{A}\mathbf{X}\theta^* = (\mathbf{X}^T\mathbf{X})^{-1}\mathbf{X}^T\mathbf{X}\theta^*$$
 (40)

$$= \theta^* \tag{41}$$

where in the second step the following equation is used:  $E[y^{(i)}] = \theta^{*T} x^{(i)}$  (trivial to obtain as  $y^{(i)}$  observe normal distribution). Therefore  $E[\theta] = \theta^*$ , implying that the estimation  $\theta$  is unbiased. Q.E.D

**2.2** Prove  $Var(\theta) = (\mathbf{X}^T \mathbf{X})^{-1} \mathbf{X}^T \sigma^2$ 

Denote  $\boldsymbol{A} = (\boldsymbol{X}^T\boldsymbol{X})^{-1}\boldsymbol{X}^T$  , therefore  $\boldsymbol{\theta} = \boldsymbol{A}\boldsymbol{y}$ .

$$Var(\theta) = Var(\mathbf{A}\mathbf{y})$$

$$= Var(\begin{bmatrix} \sum_{j} A_{1,j} y^{(j)} \\ \sum_{j} A_{2,j} y^{(j)} \\ \vdots \\ \sum_{i} A_{m,j} y^{(j)} \end{bmatrix}) = \begin{bmatrix} \sum_{j} A_{1,j} Var(y^{(j)}) \\ \sum_{j} A_{2,j} Var(y^{(j)}) \\ \vdots \\ \sum_{i} A_{m,j} Var(y^{(j)}) \end{bmatrix} = \mathbf{A} \begin{bmatrix} Var(y^{(1)}) \\ Var(y^{(2)}) \\ \vdots \\ Var(y^{(m)}) \end{bmatrix}, (43)$$

where in the second line we made used of the property of variance:

$$Var(\sum_{k} Z_{k}) = \sum_{k} Var(Z_{k}), Z_{k} \text{ is independent from each other.}$$
 (44)

Substituting  $Var(y^{(i)}) = \sigma^2$  i = 1, 2, ..., m, we have  $Var(\theta) = \mathbf{A}\sigma^2 = (\mathbf{X}^T\mathbf{X})^{-1}\mathbf{X}^T\sigma^2$ . Q.E.D.

# 3. Implementing linear regression and regularized linear regression

#### 3.1.A1

No plot for this question.

# 3.1.A2

Figure 2 plots the linear fit using parameter obtained through training, while Fig. 3 shows the convergence of the loss function against iteration times.

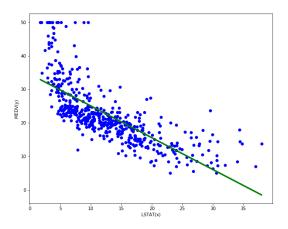

Figure 2: Fitting a linear model to the data

Figure 2 plots the linear fit using parameter obtained through training.

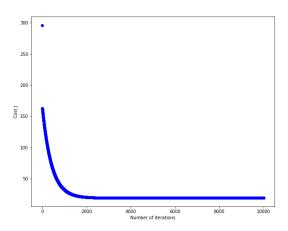

Figure 3: Convergence of Loss function against the number of iterations.

# Problem 3.1.A3: Predicting on unseen data

For lower status percentage = 5, we predict a median home value of 298034.494122For lower status percentage = 50, we predict a median home value of -129482.128898

# 3.1.B1: Feature Normalization

No plot for this question.

# 3.1.B2: Loss function and gradient descent

Figure 4 shows the loss function against the number of iterations.

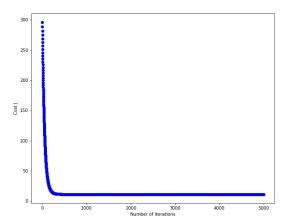

Figure 4: Fitting a linear model to the data

# 3.1.B3 Making predictions on unseen data

For average home in Boston suburbs, we predict a median home value of 225328.063241

# 3.1.B4: Normal equations

For average home in Boston suburbs, we predict a median home value of 225328.063241, which is the same as we obtained in subsec. 3.1.B3.

# Problem 3.1.B5: Exploring convergence of gradient descent

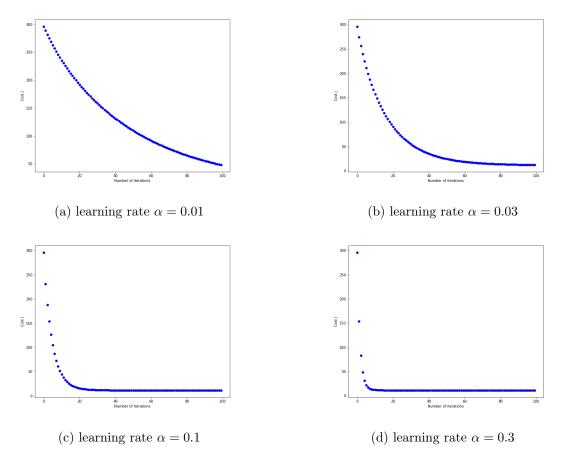

Figure 5: Convergence of gradient descent for linear regression with multiple variables using different learning rate.

 $\alpha=0.1,0.3$  and  $N_{iteration}=80$  are good trade off between accuracy and efficiency. By observing Fig. 5d , one can easily find that small  $\alpha$  (i.e.  $\alpha=0.01,0.03$ ) leads to very slow convergence rate.  $\alpha=0.1,0.3$  on the other hands, converges swiftly.

# 3.2.A1: Regularized linear regression cost function

No figures for this question.

## 3.2.A2: Gradient of the regularized linear regression cost function

Figure 6 shows the fitted curve of the linear model.

# 3.2.A3: Learning curves

Figure 7 shows the learning curve of the linear model.

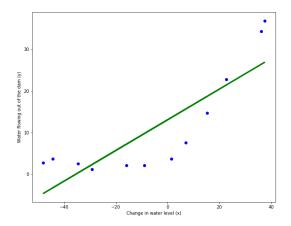

Figure 6: The fitted curve of the linear model.

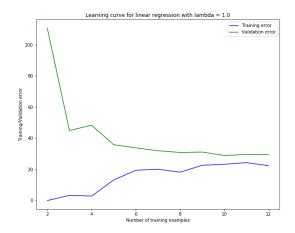

Figure 7: Learning curve of the linear model.

# 3.2.A4: Adjusting the regularization parameter

Figure 8 plots the polynomial fit and learning curves for each value of  $\lambda$ , from which we draw the following conclusions:

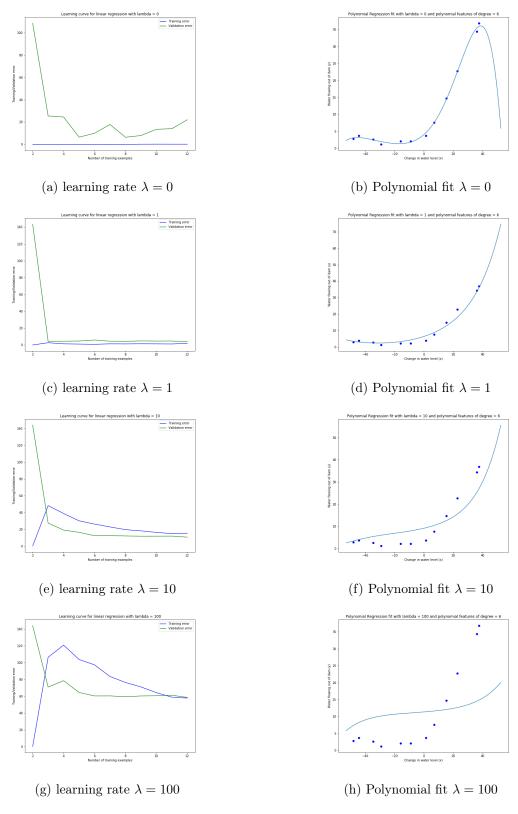

Figure 8: Convergence of gradient descent for linear regression with multiple variables using different learning rate.

If  $\lambda$  is too small, the effect of penalty term can be neglected so that the regulation will not be implemented effectively – the training model is still troubled by high-variation/over-fitting issue (as can be seen in Fig....). When  $\lambda$  is too large, the loss function is in fact dominated by the penalty term, which is a slightly similar to the biased issue that we have too strong assumptions on the model. Therefore, the training model turns to be under-fit. Only when  $\lambda$  takes appropriate value that the regulation can works effectively.

# 3.2.A5 Selecting $\lambda$ using a validation set

Figure 9 shows the variation in training/validation error with respect of regulation parameter  $\lambda$ . For the current model,  $\lambda = 1$  is approximately a good choice for the training. We list several reasons to justify our choice:

- The difference between training/validation error is too large when  $\lambda$  is significantly smaller than 1, implying an over-fitting issue which is true because the penalty term characterized by  $\lambda$  is too small to regulate the effect of excessive features.
- The difference between training/validation error becomes relatively small, but the absolute training/validation error becomes too large when  $\lambda$  gets larger than 1. This indicates that the penalty term dominates the loss function and we actually are making a strong assumption of the target function (of similar form as that of penalty term), i.e., too much bias / not enough variation.
- $\lambda = 1$  makes a good balance to avoid either overfitting or underfitting, i.e. the validation/training error is small (the prediction performance is acceptable); the difference between validation/training error is small (the prediction model is reliable).

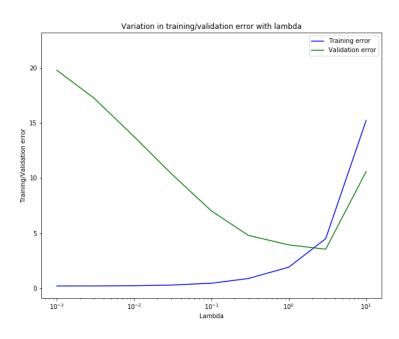

Figure 9: Variation in training/validation error with  $\lambda$ 

# 3.2.A6 Computing test set error

Error when choosing best lamdba 1.0 is 30987.4826556 (USD).
